# Developing and supporting the curriculum

## Collaboration across HWU campuses to enhance research-teaching Linkages

<ul> <li>Name author(s), and contact details:         Dr Tadhg S. O'Donovan &amp; Dr Mehdi Nazarinia     </li> <li>How does your project contribute to a research-informed and professional curriculum?         The main focus of the project was to enhance communication across campuses; as a cawas done to support Collaborative Undergraduate Mechanical Engineering Research Profeet Year Mechanical Engineering UGs must conduct an individual research project; this norn compliments the research area of the student's supervisor. Dr O'Donovan and Dr Nazarii interest in solar power and renewable energy systems and so devised project description best use of the resources on both campuses. The Edinburgh campus developed theoretic of solar power devices and systems. These were tested in solar simulators and under ide controlled laboratory conditions. The students on the Dubai campus built on the progress Edinburgh to investigate the practical performance of the solar technology under real envonditions. This reflects best practice research and development projects and in particular practice of the renewable energy technology industry.     </li> <li>How does your project support an international and multi-disciplinary curriculum? The project sought to break down barriers between the campuses; students collaborated irrespective of the geographical proximity. Documents such as engineering design drawing quotations, numerical models, computer code, research literature, progress reports and presentations were stored online and therefore were at the disposal of the whole group (in academic supervisors) efficiently. Practice presentations were webcast (UStream) and all could watch live and give feedback and/or ask questions in real-time. An added benefit to practice was the ability to record and watch at a later date; this was particularly useful for presenter to improve their own presentation techniques. Further to this My Endnote Web to share research journals and group Skype for regular and informal conferenc</li></ul>	
curriculum? communicate with ease across campuses, it was apparent that the projects quickly became led. Students on very different projects, but still needed similar tools/skills (computer codinexample) formed working groups to further their individual research projects. Fundaments background literature was also effectively shared or "pushed" to the group which enhances projects in related areas. Although each student involved had and individual project, regular collaborative group meetings enhanced engagement overall and effectively replicated the in "real" research groups and international collaborations.	ability to ame student ding for tal ced all ular

## Developing and supporting the curriculum

## 6 How does your project help to reshape the learning environment? Please refer (where relevant to):

#### Technological mediation

A fundamental objective of the project was to develop a simple, relatively cheap and reliable system to broadcast presentations and lectures etc. The system is not simply uni-directional but can be used to get feedback/questions or start an online conversation in real-time via Twitter or other social media streams. The system can also be used for video conferencing when the size of the group is "small". Because of these attributes it is hoped that the system will be replicated by colleagues throughout the University in Edinburgh, Dubai and soon in Malaysia. This approach to teaching has also gathered interest from HWU Student Union for the impact it could have students with disabilities.

### • The distribution of learning across global locations

The ability to communicate with ease is fundamental to the distribution of learning internationally. This technology has been developed and tested for that purpose and had proven to be very effective.
